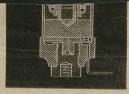

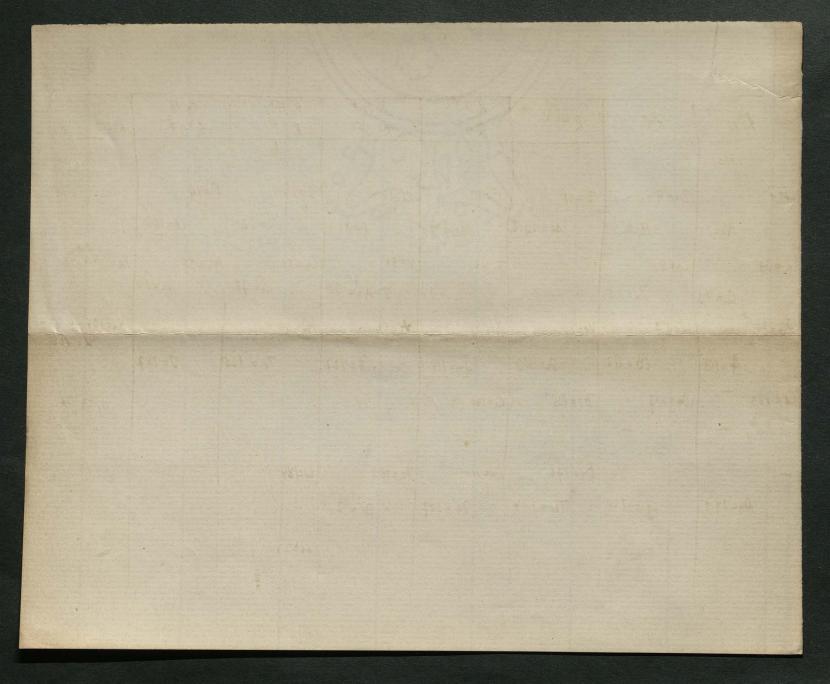

Fig. 34.

des spröden Kohlenbügels sofort zerbrechen, wogegen, wenn die Schrauben weniger fest angezogen werden, der Strom in Folge des schlechten Contactes bei seinem Uebergange aus den Drähten einen grossen Widerstand finden, an den Berührungsstellen Platin und Kohle glühend machen, ersteres schmelzen und somit in kurzer Zeit die ganze Verbindung zerstören würde. Der solcherart präparirte Bügel wird nun in die Glasglocke so weit

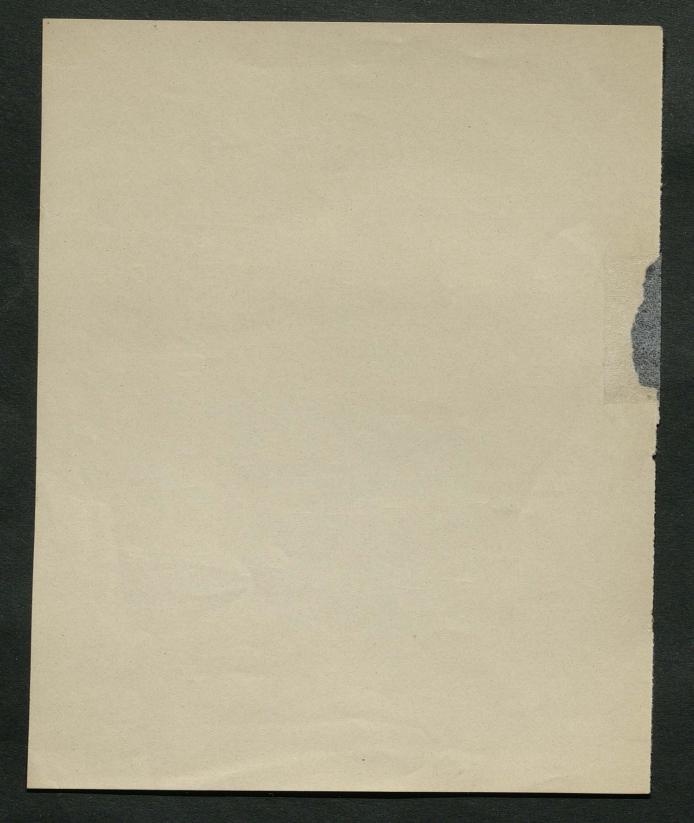

eingeführt, dass die Kohle etwa in die Mitte der Glocke zu stehen kommt. Nun werden die Platindrähte in den Lampenhals eingeschmolzen, wird die Luft aus der Glocke durch den trichterförmigen Ansatz derselben ausgepumpt und die Glocke selbst mit Gasolindämpfen wieder ausgesogen; hierauf wird ein elektrischer Strom durch den Kohlenbügel geleitet und dadurch dieser letztere zum Glühen gebracht. Die hierbei sich entwickelnde Wärme zersetzt das in der Glasglocke zurückgebliebene Gasolin: der Kohlenstoff desselben scheidet sich in den Poren des Kohlenbügels aus und gestaltet dadurch denselben zu einer homogenen und metallisch harten Masse. Schliesslich wird die Glocke vollständig luftleer gemacht und der Glastrichter zugeschmolzen, worauf die Eintrittsstellen der Platindrähte mit Gyps vergossen werden und man nunmehr die übrige, einen sicheren Contact ermöglichende Fassung darüber anbringen kann.

Schliesslich mag noch in der Reihe der älteren Constructionen auch die Glühlampe von Lane Fox Erwähnung finden, deren Leiter aus einem entsprechend geformten Stücke Cokes hergestellt wird, welches an seiner unteren Kante eine Messerklinge enthält. Um dieses Strück Cockes wird ein Hauffelde eine Messerklinge

We might get other terms arowated with proceed series by coveying out further them send on

Another course of n rs a: p (muber invole) a n3 There so this much + as - isside is avery distance of two forts the same for each ming As long as number in 2 course, rough differing by integer, this goes on gut will Of there must some a stege when success, rings cannot differ by an integer insde request: my:100 P. 106, 101 3 = 106 + 3.704 20 000 are beginned between the to rigo H: 30000 = 300 rigs To 300 ring there will be between those two rings in Mich the aways distance comot arrey, to the above rule that distances egal, therefore there must arrive at last mostable equilibrium. this this arrengement cannot go on. Ant if coop arranged in groups, much more economical. Frex. 30 of egal intervals compared with 10 groups à 3 To keep 30 stable registred 401 cmg inorde Thus by prouping then from greater stability, cross would break up & arrange trelf in groups. Radin; each of particle entary about 2000 coy? (Na Kensie)

surroundly mobile, it would be prop to current & got diffe The storm will receive energy but doo loom e- ; E = ener of aton at any time dE = x - pE  $E = \frac{\alpha}{\beta} \left( 1 - e^{-\beta t} \right)$ Suppose atoms of various kind E B still grate & ( good rad ata) by I . Eo amount of energy wounted for luminosity (In simple sity or may the thms lines of I would appear but not of I if get diff around: I will be layer : I', I' (invent disn'ty) ; then we get the lines of the second agreen first, pertably dos the mond) these lines before in with become were the frighter of the tro. With mill current dennity be favour the lives economical" will prot & which about easily and great a which about easily . This corresponds to jutting in a jor in the wrint

If or put in sulf inshitton the contrary effect; current density is reduced. The lines I are foroured. Are continuous Spark descent, but in host time greater current density If that is so, we ought to be oble to change from skeet by jutting in reliebly into next of her dent. This is to to to a cutain amount. Hydran tends to make the one done and it brigs out lines beloging to grate upon small great wrest devily.

Argon: red & their spectrom, atherfores little differen, only hydres. fection in the morrow part often very different, because my much logic count dessity In the + whom with in wen of went the fell of potential decresses; this early explain tout by this eductional product of ions, when limitarity, by accumulation (influent of necessary stons). (Otherwise this result hard to eglas Part of energy I may awar from yoth I' (like harmed for transform engy and giving of your to I). Thus if I breaks up, I will love some of the some of energy. Thurs the curve I charges joint here when I are brecking down thus not only the ser line opposing but disappearing of old line by hange of enterest denoity (organ)

These nystens may be part of the sterns (remain involve).

If they wired for very short time, it may be so small the in comparison with the time constants of. In this case (of extr. small time of exitinity yx .: E = at then the own of weres as a. Then only line of greatest chroyten would appear and petrom very simple. Its kyer collect answater which seems in high time? he thinks the stown selthing up in simple ystems. Lines of pret do: "mork lines" (, enhanced lines "Lorkyer)
of small -: are lines" If it is were a continously (byut wary caracity) would the lines come out one by one or in promps, wis ? Definity to tentimed charge, because show huminosity opposes, new emission of cop, it (kind of instability) Easin pulops start with york & just in off inchetion? Imposible that temperature has anything to do with appearant of spectra. Nichenter string on anahother would only produce withnesses years. If home. Less by cath rays, the temp (liquid air) reared, any aftert? West of temp seems to be to viewer the roughly of these corpusation Solome inflower perhaus enormous increase of wyperse. Thus bombarly of these way. may bear the same fort as elector feeld. In only ger when I derch. : more that stown, cop. + chayed stown, - how ions, also + ions gan get med amont of energy as to brush up. Much nystems and diff muttons of existences

Levert: systems which give roun of lines are chapel is as other by atoms thems does. by putting on of first to flame. and bryin of some of the lines is shifted, of others underturbed.

Symmetry or trolly orbiting is dayed (MANNER) to begin with, much system would not he appreciably moved by ele field. Dury the short time of wheatons and brimi worty It would not doplan toly approvelly. The doplant men is only organisting from the trim before the rysten became humanous. Supp. + son, attracting - very & shaker up by to, their while selecting it will be undayed. This Nich nystems are hund nows the Att of this will be just the reverse. Azzl., un hazzl, not disch: chazzl. Thus Levant forms: principal series not displaced, con to atoms first & mond mood min disple : to ions. In prot of order of pressure is much more employ than atoms. Aggrege of stores, then these systems perbobly would five out contin spoten. ( This may be the course of the continous background spectron). Two ways: movement of way, movement of + ions.

1 I we my wing can be there of by my full, only steam of + ions wide ming down on bill; this gives out system of bis, red byets If and revenut, so as to make 7, then cathodreays folling on hill, now blue light not his but phosphrenen! Much comer to pur. Li y. by bankowing his Cl, than his itself! No +K bombould give out little flams of No when oxydend, but clean neface not at all. Ind even selts than mutals there does. To for internal, now forces (chemical combination) Holande may be regarded as mucher of systems held together by mutual forces, Considuable stability. Problem of equality of mutually atter, todas. Out even for Newton's law the conditions for equitor & for stearly motion int get known anylitily. Therein of: nystem of such bodies with only forms for commit to instable equal. Out pulicips steady mution possible? 3 Profies: in order toget Conditions for stability of motion on very stringet. Fix tell egal: if steady motion countrous must be guite exceptional.

equilitriangle, with metable common rotation, like rigid body. But this is metable!

Stody meter.

Tingsmille for 3 egul bodies. Tomble of one mon very much greater than others. Another case: Max vill Sature ring. Number of stellites in the same orbit. In own to attain stability the noss of central plant must be enormously greater. Han of stillih: one that P > 0.43 n3 5 < man of setill. plant can be sotracted" with # setillitis my = 2 100 n < 7 If some of forces regulaire instead attraction much more strangent would from. Thus equilibre impossible if still replien anon other but attr. by certiff. Thus this law does not seem to join much tability. Combition for stab .: force must increase, when distance between boties in occases A p of this can be obtained by our atom.

Averye fore nothing: dos Source for nothing: don neutral but in dir. of comes always rep. (it dim) on is do of fruit attr. then newtral joint P, then rep. but I is mitable portion for my, part but stable for + electr. Thus 3 doubtons in hich table equality for + particles jossible. Int an atom thus could hold 3 other + charges in stable equilibration

Force between centres ought to be regul for mall dish but havy Doncovich: sign for gut Songelost Krund rip. Considering how murface territors voncies with thickness (Richer & Reintold) can be ditimened According to Bon. throng one march arrows from one reversal in the last of otto. Therefore o thus we get an Dos workhan were in this drution. There is a portion of this move there force incr. with dest ( negroup of stable equil.

Stolely for tangeted displacements by notating the system or in consequen of mynthe force arrivy with rapid attations Supposed the eng prober magnetic force by their notation. This face will not affect the reduct motion, but together motion turned into winde. Sugar regulars (on (going the dith) and mynth full m dx = ux + He dy ys eight mdj = my - He dx -x(mp+p) = Heigh -y(mp2+p) = -Heipx { (mp+ fa) = H2e p2 stable if a red wats. mptp = #Hep. ト= 主 He # 1 (を出)- Am if >0 the tobal 1 He > 1/m constion the total) byten itth for one dead, motable for another aboution, cannot made stable by myselis Until now ex com I'm favor or dayed options At somber yether also for unhazed atoms system of magnets (mented atom) thus stath youther wor for newtool atoms

? If four on short Etype a mularget Mayie Some may be of our, roun of the other type. Hydroge ston cherged, Face Algo. Che day nearly on al days on H down, with the serve charge and be altered much offy by replacing this atom by other Kind Horse into not be altered much offy Faces of 19 type, on the contrary will depend entirely on the returned structure of the storm. Then by replacing this H by other storm, whole worker changed, pertably motall. It If atom in mil hogy? Atoms in custain molecules seem to carry days. Retation of plane of polars aton (hyper) is easily explained if the darm chayed. fours only in 4 ages stattity. Carbon ston If days the same a mome equal, then / (c) ver of would tol light only turns the round but relation poster agred , four in it any Out it mores imegal, then diploumt imagnel, do tother organistis and forus on introl store altered Sorw- Meet

3. We did can't comme the volvey to be = member of ryons of stably round the otom o Itable equally josth only if momber of down morning the certical one is landing because they are regulling each other. Thus it is not lakely that each of those regions contains its storm. and may charge the Athlety would from This can be colulated only if low if central face is known exceeding Orion ony of four a dist 5 would be the man number (because 6 mintall) thro hays of - to be toke into accord on which store if much argent i) Ly --- = for of other of what atom dayst. 3). Conglots mor if a. a. charget point of equilibrium brought in If the sold form due to charge is large, then no point of egothing Thus there must be a limit of harge for the cutied atom. It'd supposed to be nested atom expelient of the pleas of the by 40 (doubt copy) against to the constitution of the pleas of please by 40 because certail often within cose must also take light charges and this would destroy tolky but forthy the time itself count bears the clay of much amount [darge organited by taking away or in corporating and this process semetail] Atom may be mable from his astere to loose more than certain number of every. Charige of soleney may arise from high tempor V = really change of Armond proportion

F. ex: Fe easy investigated beam my In ferrous selts: K (wife of organ) = musher of down in inter when so count In other combaction (Fe Gg Ke) Fe is not magnificated. Chay Loss of mag, in Fe at certain temper. | Recales unce Out this many be quite generally the case Some selts gregored in vet way are deprent from these present in dry way. Time give off then heatest enormous amount of my, engrape. Then can be constructed an engine working by think loss of thermodyn! There must be some some of energy some hange toking place. Mas 2n 0. Mohols & how here weement the red offen coming off from 200. Normal of to a certain temper, from this temp a much preter radiation. Some change?

If really the optical constants are altered (and probably most for those rays which are spicacions in production of cathods rays) thus they must depend on the strength of the incident light itself!

This would be demonstrated easier by meaning the ellipticity with strong.

A weak light.

Age agintal sit to age and with the strong and with the same and

Does UVL produce a change in the aptical contents of metals? a). generally, by increasing the muchan of free elections and community therefore (very small?) b). by splittering special knows of atoms, by curtain wordsons, probably the same which have correspondy frequency of whateon Index of repeation, absorption, ellipticity (principal indexe principal assumt) reflective power Only relative measurements with & without rays. He 1). Appetical 2114 transport lager -Shutrometer (or frutrophotomti)
adjustable slots) your part of slit exposed to UVI lover not " Owbebly most senstive method: of light (to be memoral)

To Phosphores en ce produced by UVLs on mitals ? Anc eyeor thermopile orphouses series, (bolomuter) Charr metal layer In transport light: Atten with Rb in vacuo

Ellythity (in dikyon yol, as must projet) Optical constants. Directs mesiments of n (who of reporter) and k (aboution) in this layers unpractical Shorton Attr: Guerrplate, covered with motol ? but absorption of WM in Reflective power the the delayer!

Superficial changes of metals, while emitting cett arrays mark action of UVL.

Conductivity of transporent metal clayers, is it changed by UVL ?

Free Surface (in air) may change rapidly by the action of UVL

Out metallic layer deposited on quarz plate and shone on from balkers?

(Thomson's theory of metallic conduction: Rapports Course I 1. 138)

When UVL produces cothod rays, there ought to be produced Rongin rays too.

I untransport layer of Rb or other metal

Avt

Joes UVL jonize Na vegour?

To Au-glass (Soldrubin) (ith attransmorkopeled partides of An) not undergring duried hange in UVL ? Or shorthousand?

The emomion of cathod rays by WZ, does it depend on strength of electric feld onto de or not?

ontoide or not?

gnantity of electricity corried away by UVX

D. If not, then the deposition of abolive scarge in vacuum must be indqualit

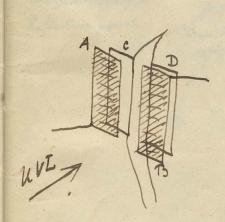

of difference of potential [except contrary EMF sufferent to throw then back]

of deference of potential [except contrary EMF sufferent to throw them back]

2). Then the amount of work necessary for transfer the particles could be colenlated from measurements of their at deferent strengths of feeld (Lenard).

3). If, on the contrary, the strength of destrict full has an influence on the amount

3). If, on the contrary, the strugth of steeties full has an influence on the amount of particles town off the (what can be shown by (1)), then the work required to tear off the particles can be shown by the following arrangement

NVE falls through the two simular metalice nets AB on the similar plates CD the rentement of shock is measured by brodge mother (Loke bolombia) A has the same potented as C

I has a possibly great of pot versus I

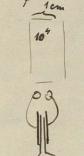

Will there exist any deft. of teny. in C, D (cooling of the
